

Sharia Banking Performance Measurement Challenges

¹Meithiana Indrasari, ²Ari Purwadi, ³Siti Mujanah, ⁴Zulkifli, ⁵Phong Thanh Nguyen

ABSTRACT--Execution assessment on Sharia budgetary foundations, particularly Sharia banks, intends to gauge the exhibition and strength of banks dependent on the recently set targets. This is done as a control to improve future execution by distinguishing inadequacies of Sharia banks activity consistently. Building the correct exhibition estimation appropriate with the attributes of an organization is a significant angle, particularly in a world unbounded, to stay serious and monetarily solid. As a bank that works dependent on Sharia values, there are sensible results in particular certain criteria that must be met in the operational procedure. There are in any event three components of execution that are significant attributes in the operational act of Sharia banks. To start with, Sharia banks in completing their activity, as a major aspect of the financial facet, are benefit situated. Notwithstanding, profit must be accomplished through tasks that hold fast to Sharia values.

Keywords-- sharia banking, financial institution, circulating assets, measurement

I. INTRODUCTION

Sharia banks in doing their job and capacities must maintain the standards of equity and fellowship. Third, Sharia banks in conveying salary and riches must be equivalent. One of the guiding principle that structure the vision and mission of Sharia banks is that all assets essentially belong to Allah. Therefore, Sharia banks must be focused on this point of view by circulating assets similarly to assemble a gainful society. Subsequently, it very well may be said that Sharia banks have a job as business element, yet additionally as social and da'wah substance through item advancement dependent on Sharia morals and good standards. Along these lines, the exhibition of Sharia banks isn't restricted to the money related angle, yet additionally should be connected to the social and da'wah execution where the Sharia banks are found. This requires an exhibition estimation model that can quantify both money related and non-monetary execution of Sharia banks. A few presentation stage and criteria that are in accordance with Sharia standards are solidified in the detailing of an exhibition estimation that can control and assess Sharia banks to ensure they remain in accordance with these standards.

The instance of Bank Muamalat that neglected to meet its base capital prerequisite of 12 percent uncovers a few auxiliary issues dissolving sharia banks in Indonesia. Notwithstanding this issue, sharia banks additionally need to improve their intensity to stay aware of customary banks. This can be accomplished principally through enhancements in business effectiveness and an attention on notable business sections.

II. IMPROVING SHARIA BANKING PERFORMANCE

To start with, sharia banks need to improve their business proficiency. In September, sharia banks' arrival on resources (ROA) and net working edge (NOM) remained at 1.66 and 1.84 percent, individually. In the interim, customary banks'ROA and net premium edge (NIM) remained at 3.52 and 4.2 percent around the same time. These figures show that sharia banks are less proficient than ordinary banks. High costs erode their profitability, which leads to lower capital increase. As a consequence, their assets (mainly driven by financing) growth will be constrained by the capital requirement. In other words, sharia banks will face difficulties in growing their financing from the asset side, since they can only raise limited capital from the equity side. In addition, less efficient business compels sharia banks to charge higher prices when channeling their funds to borrowers in order to sustain a profitable business. Consequentially, they are unable to compete with conventional banks that have greater efficiency and lower prices. To deal with this issue, some sharia banks turn to subprime borrowers with higher credit risk, further undermining their competitiveness. Business efficiency can be achieved by streamlining workflows, improving the integration of a bank's information technology (IT) systems, upgrading data reporting and improving compliance and risk management efficiency. The implementation of these processes is not easy but feasible, since guidelines for benchmarking are widely available.

Second, sharia banks have to exploit their competitive advantage by focusing on business segments not dominated by conventional banks. Due to the lack of expertise, the attempts made by a number of sharia banks to expand in the corporate segment resulted in increased nonperforming financing that eventually eroded their profitability instead of increasing it. Instead, sharia banks need to focus on smaller borrowers, such as retailers and small and medium enterprises (SMEs).This segment has vast room to be exploited considering the low financial inclusion rate in Indonesia. A 2018 report from the World Bank shows that the rate was only 49 percent in 2017. Even though the businesses of retailers and SMEs are less sophisticated than those of corporates, assessing their risk is easier. If sharia banks can improve their risk management system in this segment-for instance by improving borrower screening, data management and financial analysis-the risk associated with financing retailers and SMEs can be mitigated.

Figure 1: Islamic Financial System

Figure 1 shows Islamic Financial System. Therefore, sharia banks face some structural challenges that hamper their business growth. These challenges include the lack of risk culture and a less competitive business model. Fortunately, these problems can be resolved in a realistic manner. Since all of these challenges are interrelated, they have to be tackled simultaneously.

In the previous article, I suggested the implementation of thorough risk assessment in compliance with Basel III requirement and credit risk specialization (subject-matter experts) to improve the risk culture in sharia banks. We think back-end office investment, such as to improve data reporting and IT integration, will improve the efficiency of sharia banks. Credit or business segment specialization also leads to a more focused business model and greater efficiency through a lower nonperforming financing that eventually can improve the competitiveness of sharia banks. This condition is supported further by the growing demand for sharia-related products in Indonesia and strong government support in promoting the industry. If all of these factors are combined, sharia banks have a lot of potential to grow their business sustainably.

III. ESTIMATION OF SHARIA BANKS WELLBEING

Execution estimation is firmly identified with corporate administration, in which one of the apparatuses to gauge the nature of corporate administration is through execution estimation. This implies execution estimation is an appraisal, assessment and thought reason for improving the nature of Sharia bank administration. It is important to remake execution estimations that is created from the substance of Sharia banks an incentive as neighborhood shrewdness to have the option to reveal the nature of Sharia bank administration in its job as a business, social and da'wah element.

As to estimation of Sharia banks wellbeing, BI set up Bank Indonesia Regulation (PBI) No 91/1/PBI/2007 concerning the Health Evaluation System for Sharia Banks. BI stressed that the money related wellbeing level of Sharia banks is dictated by CAMELS factors which include quantitative evaluation utilizing Capital, Asset Quality, Earnings, Liquidity and Sensitivity to Market Risk (CAEL) proportions and subjective appraisals of the executives. Concerning appraisals, BI repeated that subjective evaluations is an appraisal of the variables that help the consequences of quantitative appraisals. Along these lines, in view of this article, the executives quality factor is situated as a supporting variable in accomplishing money related execution. In this way, money related viewpoints are at the center of operational objectives, which guides the executives to unify their operational procedures just on accomplishing budgetary execution. While the non-budgetary perspectives, particularly the elaboration of Shariaethics and ethics which are significant qualities, are disregarded.

IV. CONCLUSION

Analysis of traditional monetary execution estimation which expresses that the administration conduct of Sharia banks that actualize CAMELS and RGENC as a presentation estimation device, will be co-selected by values that attention on money related objectives as top need. Sharia banks will be decreased to material and individual arranged banks, which will prompt broken conduct of Sharia bank the board as an expert in completing bank

activities. Inquiring about which discovered useless conduct, for example, overlooking the arrangement of gainful subsidizing to little clients. Deviation of Sharia standards in the enhancement of Sharia banks items to accomplish greatest benefit. Sharia notoriety is a central point for clients to pick Sharia banks, consequently, worries of client distrust in Sharia banks develops as this useless conduct comes open. In the interim, expressed that ordinary execution estimation that have been actualized in Sharia banks depends on utilitarianism morals esteem which is clashing with the attributes of Sharia banks. Hence, it is important to assemble a model for estimating the budgetary presentation of Sharia banks. The primary center is the manner by which the estimation models would have the option to speak to the capacities and duties of Sharia banks as business, social and da'wah foundations.
